[Government: Battery Management Division]
Battery Replacement Order
If disobey the order, citizens will be subjected to forcible enforement by the Battery Management Division (Imagine DEA in reaal life)
Monitoring citizen's battery usage and tendency
Periodically inform/warn battery replacement
Government Side:
For national growth, the government wants more citizens to use the battery consistantly and guides toward the competetive development
Productivity/Work efficiency increase
Every 10 years(average) or 5 years(heavy use), reaches the battry's capacity and needs to be replaced
The 'Ultimate Battery' attached to the human body/inside emits electrical signal
-> Enhance Performance && Replace sleeping, eating, resting
Battery Driven Huamn
Additional Ideas
Imagination No.1
What if the 'Ultimate battery' itself had a high value and need to reuse it for next generations?
->
Battery might be exetremly important, and recycling becomes a majoy industry, they might start extracting batteries from dead body
Imagination No.2
The Ultimate Battery -> replace body parts/organs with electronics/machines
Because, we could use electricity/energy anytime and anywhere, as much as we want
->
If someone steal the energy from someone's battery, they could simply die
(Like wireless NFC can take money from your card)
If no charging singularity?
->
Extreme battery value increase
Demand >>>> Supply
Also requires Battery 'Charging' singularity
Battery Singularity
Possibility:
No life without battery
Robot/Machine's limitation:
Still can't apply to every circumstance
Why using battery driven human, instead of machine?
Battery Driven Huamn
-
(Able to replace battery)
Use electricity 'whenever/wherever' we want
3. Humans after Earth
Transhumanism
Posthumanism
Accelerationism
4. Earth after Humans
Nonhuman phenomenology
Postnatural organisms
Cyclonopedia
1. Humans before Earth
Teleology
Exceptionalism
->
Strengthening the hierarchy
Possibilities
1. Solar panel accessibility
2. Battery performance increase
Endless Labor by replacing battery
Geology
More intense hierarchy structure
Bad influence on the eco system
Echo-friendly
Accessibility
Requires MORE ENERGY to make it
Only few can access to high-tech
Flawless infinite energy storing battery
Advanced, but still limitation (Expectation: x10 better than now)
Every electronic will be more
Small / Light / Safe / Strong / Long
What can happen with it in the future?
DYSTOPIA Side
Let's assums there's a "Ultimate Battery"
UTOPIA Side
'Super-Micro' Electronics
Anyone can access to high-tech
In side of body
Out side of body
Artificial Bio / Organ
Battery Driven Joint Enhance
Battery Driven AI Robot body
Higher performance Exo-skeleton
Apply it to other oraganism
Animals, organics...
' Battery will save us '
Reaches '— Punk era'
Technology itself becomes the priority, and humans are pushed to second place.
What if:
Every asspect improves, except 'safety'
What if:
Performannce increases, but the size get bigger
What if the development of battery technology is biased in one side?
" Eventually, being more small / powerful / efficient / safer "
For better battery, what is required?
???
Next Generation Battrery
1. Graphene Battery
2. Lithium - Air
3. Lithium - sulfur
4. Solid-state battery
5. Flow Battery
6. ...
Failure to commercialize the next gen battery
What if the battery fails to develop beyond current technology level?
Lithium is the 33rd most abundant element on Earth
But, still possible to use it all up
The Lithium recycling industry develops
Find ways to extract Lithium from other planets
Lithium Battery Recycling Industry
What's next?
Every battery has Pros/Cons
1. High energy efficiency
2. Low cost
1. High cost
2. Inflating issue
1. Safety Prob
2. Less flexible
1. Even higher energy
2. Flexible
3. Light weight
Good? Bad?
Also, Lithium Polymer battery
Lithium-ion battery dominant
Requires 'better' battery
Better Performance
Battery power
Super-conductive system
Will be Lighter / Smaller
Being mobile
Efficiency?
Better energy managing system?
Advanced tech?
No Battery -> using local energy
Will be Heavier / Bigger
PRESENT
Always, the battery was aimmed to use energy whenever/whenever we need
1990s: Lithium-ion and modern battery
Much higher energy density
Good cycle life
Used in...
1.Laptop
2. Mobile Phone
3. Digital camera
->
Device which requires higher power
Battery starts to aim "mobility"
1950s: Alkaline Battery
AA, AAA batteries...
Used in...
1.Portable Radios
2. Cassette Players
3. Remote controller
Late 19C: First portable devices
'Leclanche cell', first 'dry cell'
-> 1899, first Nickel-cadmium battery by Waldemar Junger
Used in...
1. Flashlights
2. Early portable radios
Used in...
1. Early lighting systems
2. Railways and telecommunication backup
3. Car starter battery
1859: Lead-Acid, Rechargable battery
Gasten Plante invented
It was heavy, but robust and relatively cheap
Powering Telegraph Networks
Long-distance telegraph lines spread across continents ->
It was powered by chemical batteris
The Daniel Cell'
1836, more stable and lasted longer
1800: Alessandro Volta's first battery
'Voltaic Pile'
This produced a continous direct current for the first time
